

ABSTRACT

(0022) An electrical circuit test apparatus for testing a three-conductor electrical circuit outlet connected to an associated circuit breaker. The three-conductor connections are the electrically active (Hot), neutral and ground. Any suitable color-coding either
5 national or international may, if desired, be used to identify the electrically active (Hot), neutral and ground electrical conductors. A three -conductor electrical cable is connected at one end to a three-prong plug. The other end of the electrical cable is connected to the electrical test apparatus that determines and indicates the current energized state of the circuit breaker.
